## **SYSTEM CHARACTERISTICS**

---

### **RF SECTION**

<b>FREQUENCY RANGE</b>	<b>FM 87.5÷108 MHz band.</b> Frequency carrier presetable only from 87.6 to 107.9MHz on the front panel in 100KHz increments, with an internal fine frequency adjustments. Other bands from 50MHz up to 108MHz and 10KHz steps available.
<b>MAX. POWER OUTPUT</b>	2 to 40W with 2W step, presetable on the front panel.(max. power continuosly variable)
<b>TYPE</b>	Solid state, direct FM frequency synthesized, crystal referenced, thermal compensated.
<b>RF POWER</b>	output connector: type N female, 50 impedance : 50 power stability : better than 1dB
<b>FREQUENCY STABILITY</b>	Better than 5 ppm, 0 °C to 40 °C
<b>MODULATION TYPE</b>	F3, direct FM at the carrier frequency.
<b>ASYNCHRONOUS (no AM S/N RATIO</b>	60dB below reference carrier with 100% AM modulation, 50 s de-emphasis FM modulation present).
<b>SYNCHRONOUS AM S/N RATIO</b>	60dB below reference carrier with 100% AM modulation (FM modulation ±75KHz).
<b>HARM. or SUB-HARM. EMISSION</b>	70 dBc or more below carrier level
<b>SPURIOUS ANTENNA EMISSION</b>	<-85dBc.
<b>CARRIER SPURIOUS TX EMISSION</b> (no antenna output measured)	<-70dB (in accordance with Decr. 311 art. 16)
<b>TX SPURIOUS EMISSION</b> (no antenna output measured)	<-90dB (in accordance with Decr. 311 art. 16)

---

### **MODULATION SECTION**

#### **MOD. CAPABILITY**

<b>Option MX</b>	One Composite program (balanced or unbalanced input) and 3 subcarrier channels (SCA) up to 100KHz.
<b>Option MF</b>	One Mono (balanced or un-balanced input), one Composite program and 3 subcarrier channels (SCA) up to 200KHz.
<b>Option ST</b>	One Mono or Stereo (L and R channel, balanced or unbalanced input) or Composite program and 3 subcarrier channels (SCA) up to 200KHz.
<b>MOD. INPUTS</b>	
<b>SCA</b>	10k impedance, frequency range 20KHz÷200KHz. All levels are factory set for +6dBm and adjustable in the 0÷12dBm range. Input connector: BNC.
<b>Ext. MPX</b>	10K impedance, frequency range 20Hz÷100KHz. The level is factory set for +6dBm and is adjustable in the 0 to +12dBm range. Input connector: BNC.
<b>Left /Right Channel</b>	Input impedance selectable 600 or 10K , frequency range 20÷15000Hz. Input level is factory set for +6dBm (different levels on request) and is adjustable in the 0÷+12dBm range. Input connector: balance Canon XLR, unbalanced BNC.
<b>COMPOSITE</b>	
<b>FM S/N RATIO</b>	(referred to ±75KHz dev and with 50 S de.emph)
<b>Mono</b>	80 dB, 85dB typical (with a 30÷20000Hz filter bandwith).
<b>Int. Stereo</b>	80dB (L-R, decoded and with a 30Hz÷20000 filter bandwith).
<b>Ext. Stereo (MPX)</b>	80dB (L-R, decoded and with a 30÷20000Hz filter bandwith).
<b>TOTAL HARM. DISTORTION</b>	
F=±75KHz and with 50 s de.emph.)	
<b>Mono</b>	<0.03% - 0.02% typical
<b>Int. Stereo (L/R Ch)</b>	<0.04% - 0.02% typical (L-R, decoded and with a 30Hz÷20000 filter bandwith).
<b>Ext. Stereo (MPX)</b>	<0.04% - 0.02% typical (L-R, decoded and with a 30Hz÷20000 filter bandwith).
<b>STEREO SEPARATION</b>	
<b>Baseb. monitor out</b>	Greater than 65dB 100Hz to 15KHz Greater than 60dB 40Hz to 15KHz. Greater than 50dB 40Hz to 15KHz
<b>TX</b>	
<b>COMPOSITE</b>	
<b>AMPLITUDE RESPONSE</b>	
<b>Mono</b>	±0.15 dB - typ. 0.12dB [30Hz÷15KHz] <-45dB at 19KHz (typ. 55dB).
<b>Int. Stereo (L/R Ch)</b>	±0.15 dB - typ. 0.12dB [30Hz÷15KHz] <-45dB at 19KHz (typ. 55dB).
<b>Ext. Stereo (MPX)</b>	<±0.1 dB [30Hz÷15KHz].
<b>SCA 1, 2, 3</b>	<±1 dB [20KHz÷200KHz].
<b>COMPOSITE</b>	
<b>PHASE RESPONSE</b>	±0.5 from linear phase [30Hz÷53KHz]
<b>PRE-EMPHASIS VALUE</b>	75 s for FCC or 50 s for CCIR (factory set).
<b>PRE-EMPHASIS ERROR</b>	<±0.1dB.

## FACILITIES

<b>MULTIMETER</b>	4 function diagnostic aid: peak and semipeak modulation, forward and reflected power
<b>MONITORING</b>	
<b>Leds</b>	-12 +5 +12 +24 Vdc. Transmitter PLL lock. Pre-emphasys presence. <b>(option MF or ST)</b> Internal coder "ON" <b>(option ST).</b> Overmodulation. <b>(option MF or ST)</b>
<b>BNC connector</b>	Carrier enable input, active grounded. 19KHz output, to syncronize external devices (i.e. RDS). <b>(option ST)</b> Sync. input for an external 2.5KHz clock TTL compatible, to synchronize PLL oscillator (for FM syncro).
<b>SETTING</b>	Output frequency 87.6÷107.9MHz, step 100KHz. (Other frequency range and 10KHz step on request.) Max. Forward power continuosly variable. Forward power 2÷36W 2W step Refelected power continuosly variable 1÷10W. Baseband VCO input -6 ÷ +5dB 1dB step

---

## GENERAL CHARACTERISTICS

<b>ENVIRONMENTAL CONDITIONS</b>	
<b>Temperature</b>	Operating: 0 °C ÷ +40 °C Non-operating: -20 °C ÷ +50 °C
<b>Humidity</b>	Operating: up to 95% relative humidity (non-condensing) at +40 °C Non-operating: up to 90% relative humidity at +65 °C
<b>Altitude</b>	Operating: up to 4600 meters Non-operating: up to 15000 meters
<b>POWER REQUIREMENTS</b>	
<b>Voltage</b>	100/120/220/240 Vac -% to +% 50-66Hz
<b>Power</b>	160VA maximum
<b>WEIGHT</b>	
<b>Net</b>	approximately 16 kg.
<b>Shipping</b>	approximately 18 kg.
<b>DIMENSION</b>	
<b>Cabinet size</b>	48.26 cm wide x 13.33 cm high x 48.26 cm deep.
<b>Boxed</b>	60 cm wide x 21 cm high x 59 cm deep

---

## REQUIREMENTS

ELCA HPT SISTEM meet or exceed all CCR, ETSI and FCC requirements and particularly:

IT. D.M. n 311 dated 09/03/94

Italian requirements to ratify Radio broadcasting transmitters (frequency or amplitude modulated) and TV transmitters.

ETS - 300 -384

Radio broadcasting system; VHF, frequency modulated, sound broadcasting transmitter

CCIR - 450

Transmission standards for FM sound broadcasting at VHF

CCIR - 412

Planning standards for FM sound broadcasting at VHF

CCIR - 559

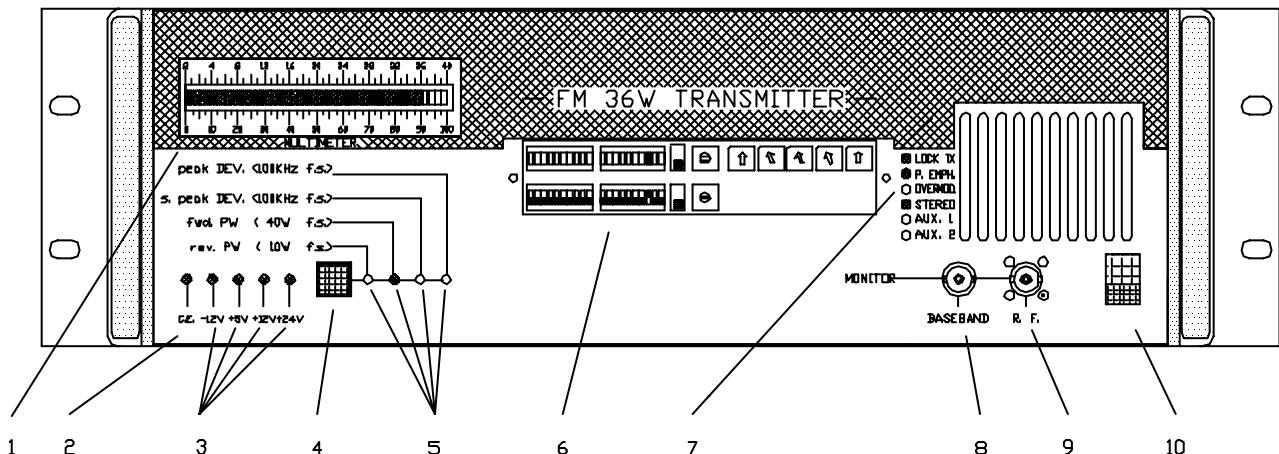

Objective measurement for radio frequency protection ratios in LF, MF and FH broadcasting

CCIR - 468

Measurement of audio frequency noise voltage levels in sound broadcasting.

## *CONTROLS and INDICATORS*

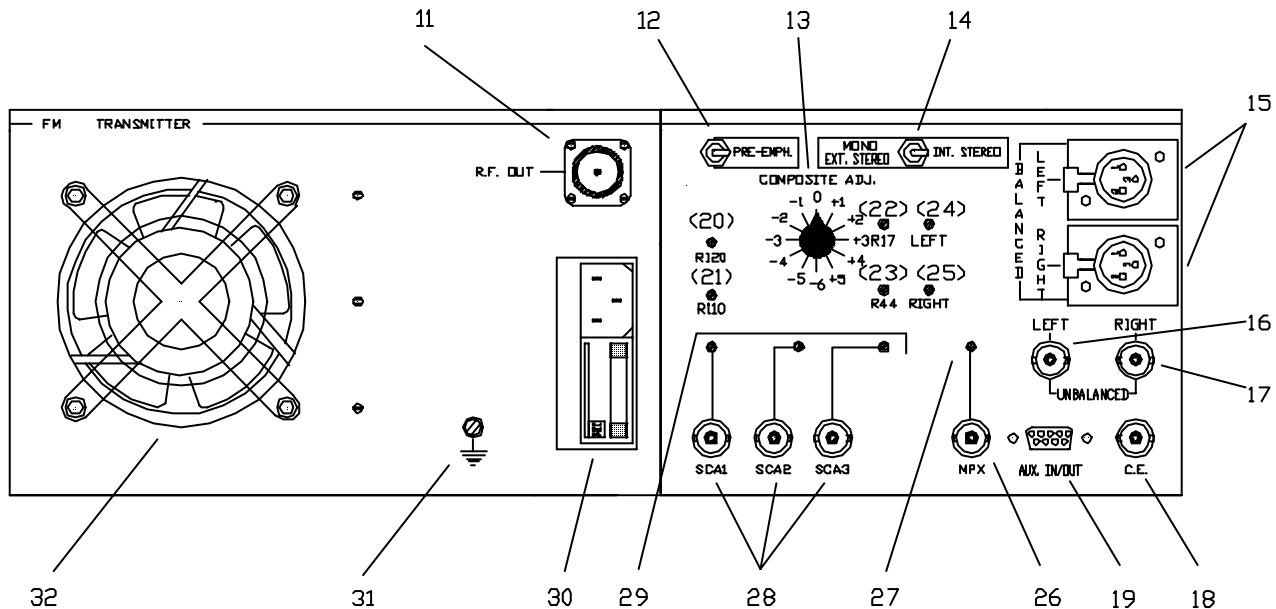

### FRONT PANEL

- 1 **FUNCTION METER** Multimeter measuring the functions (5)  
Upper scale: Reflected (10Wf.s.) and Forward Power (40W f.s.)  
Lower scale: Semi-peak and Peak deviation (100KHz f.s.)
- 2 **CARRIER ENABLE** Led "ON": carrier presence (R.F. Power)  
Connecting to ground the corresponding BNC connector on the rear panel (14) the Radio-Frequency Power is immediately switched-off, as the PLL remains locked.
- 3 **POWER SUPPLY** Leds "ON": internal power supply voltages presence (-12, +5, +12, +24Vdc)
- 4 **FUNCTION SELECTOR** Push it to select the measurement required (5).
- 5 **FUNCTION LEDS** Leds "ON": they correspond to the measurement selected by pushing the function selector (4) and displayed by the Function Meter (1).
- 6 **[SETTINGS]** Power and Frequency settings.
- 7 **FUNCTIONS LEDS**

LOCK TX	: lighted when TX is locked
P.ENPH	: lighted when Pre-emphasys is inserted (option MF and ST)
OVERMOD	: lighted when the Audio input level exceeds the threshold (option MF and ST)
STEREO	: lighted when internal Stereogenerator is inserted (option ST)
- 8 **BASEBAND MONITOR** BNC connector: composite signal control 30Hz÷200KHz.
- 9 **R.F. MONITOR** BNC connector: R.F. output for testing, -40dBc.
- 10 **A.C. POWER SWITCH**

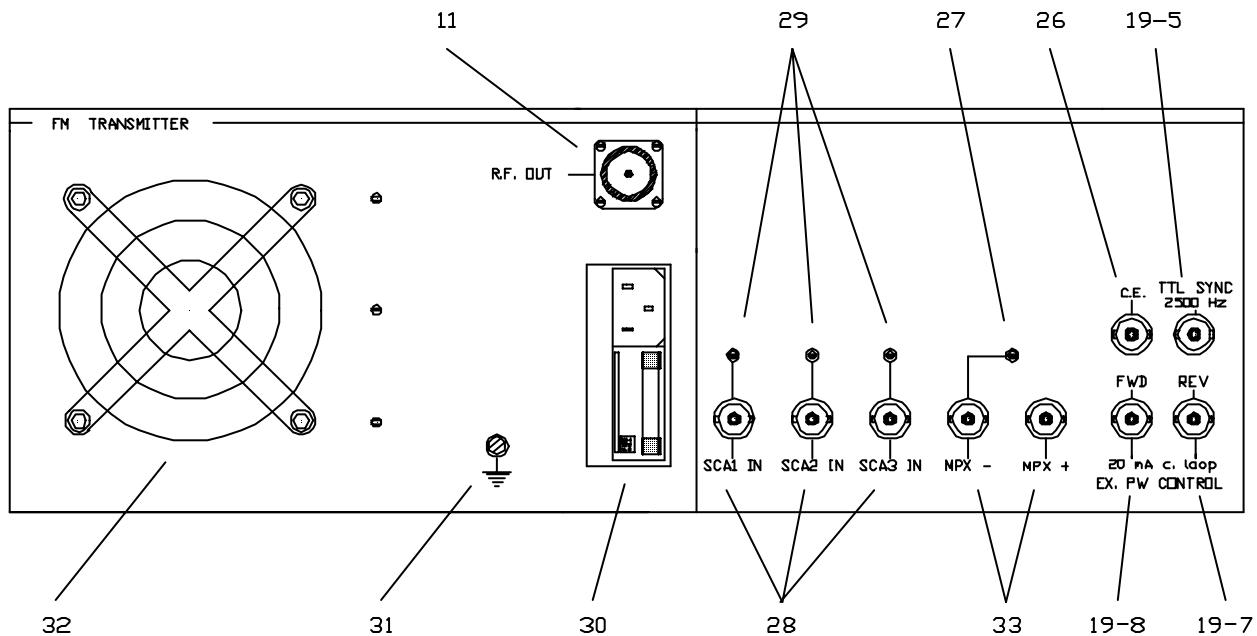

## REAR PANEL (OPTION MF-LM-ST))

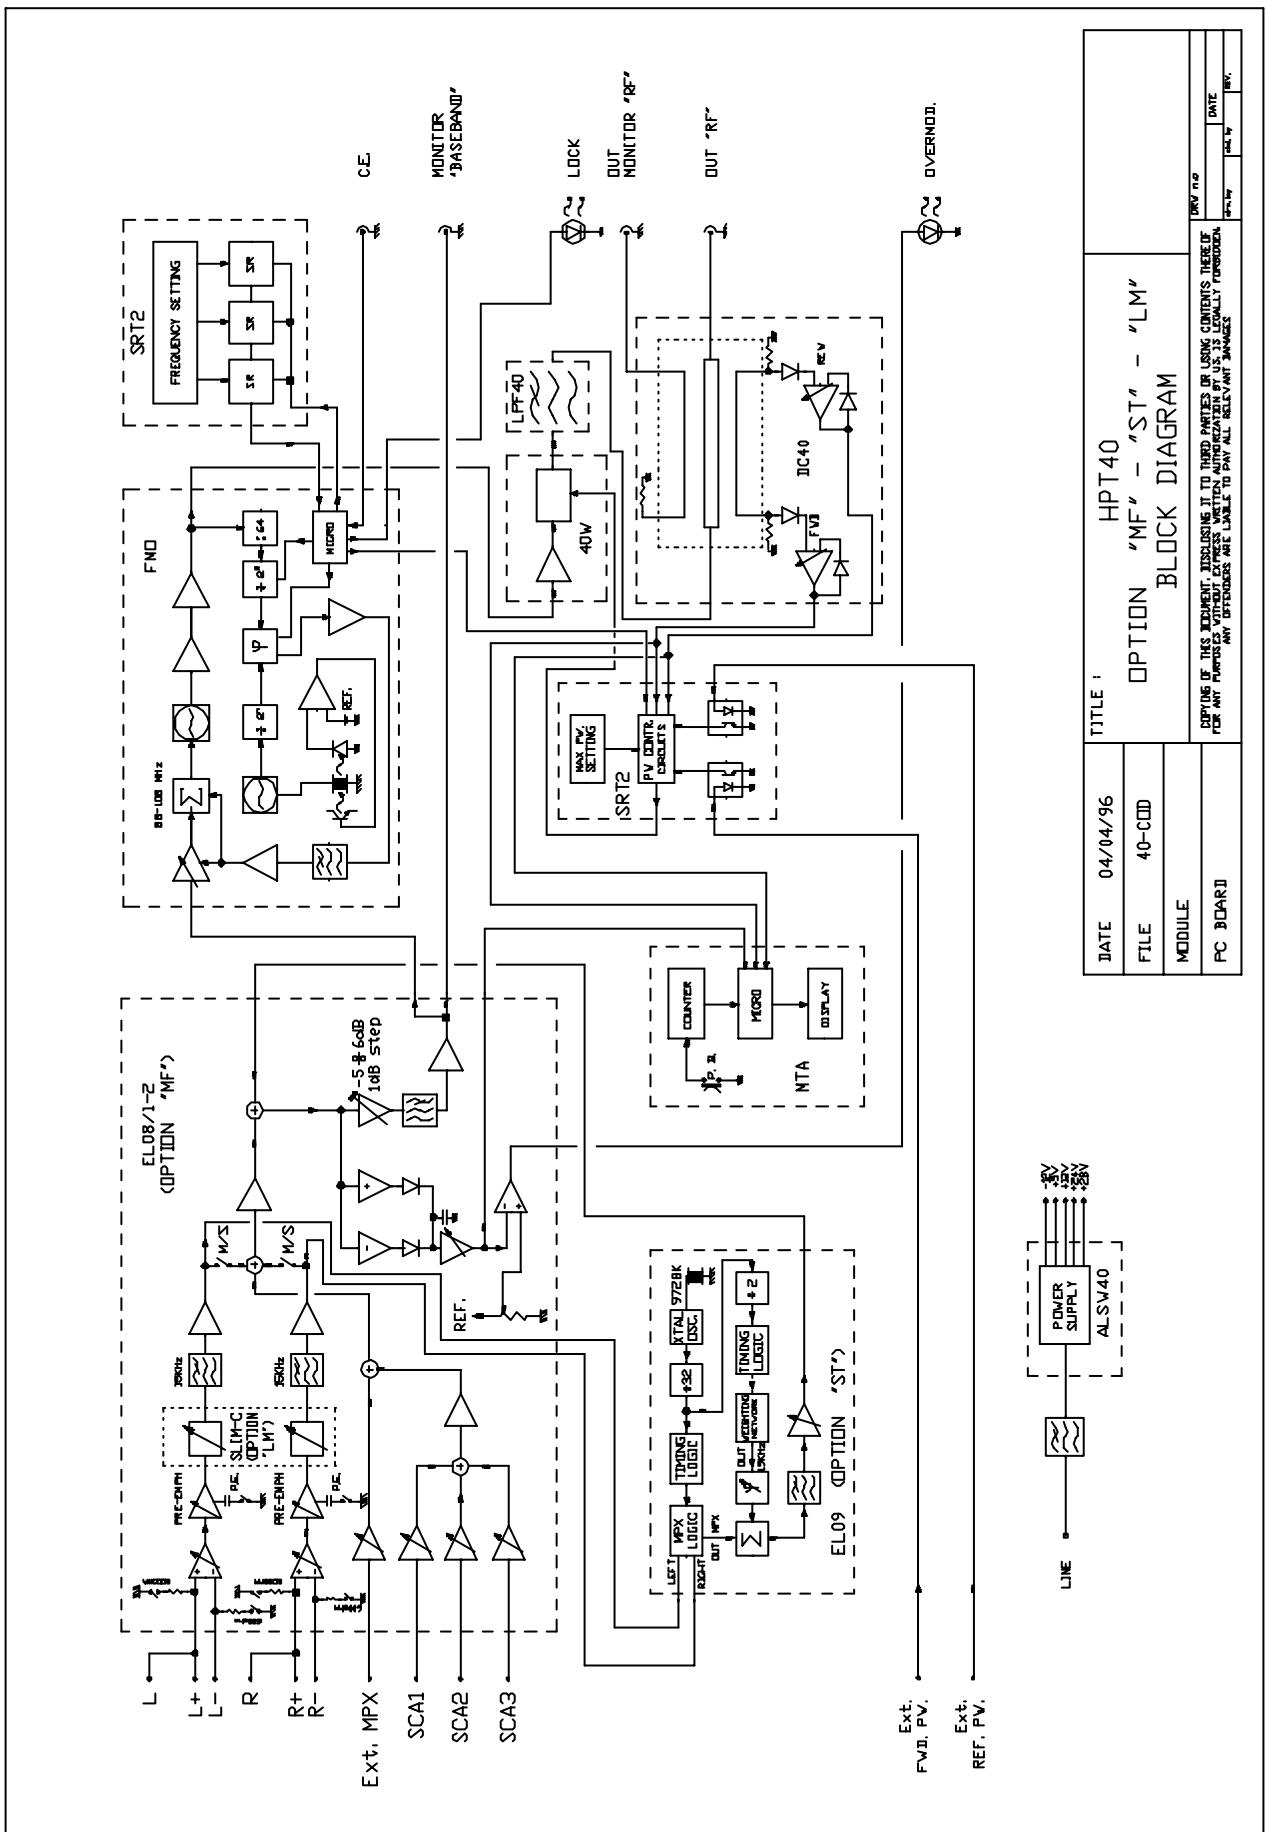

- |           |                               |  |
|-----------|-------------------------------|--|
| <b>11</b> | <b>R.F. OUTPUT</b>            | Type "N" connector, 50 .   |
| <b>12</b> | <b>PRE-EMPHASIS</b>           | switch, for pre-emphasis insertion, L/R Channel (option MF and ST) .   |
| <b>13</b> | <b>COMPOSITE ADJ.</b>         | multiswitch to adjust composite level, 1dB step (-6÷+5dB) (option MF and ST).  |
| <b>14</b> | <b>EXT/INT CODER</b>          | switch to select int. stereo operation or ext. mono /MPX operation (option ST)   |
| <b>15</b> | <b>L/R BALANCED</b>           | CANON XLR connector: pin 1= ground. pin 2= +Signal.<br>pin 3= -Signal (option MF and ST).  |
| <b>16</b> | <b>LEFT UNBALANCED</b>        | BNC connector for unbalanced Left Channel input (option MF and ST).  |
| <b>17</b> | <b>RIGHT UNBALANCED</b>       | BNC connector for unbalanced Right Channel input (option MF and ST).   |
| <b>18</b> | <b>CARRIER ENABLE</b>         | BNC connector carrier enable command: when connected to ground, the corresponding led (2) on the front panel and the R.F. power output are switched-off.   |
| <b>19</b> | <b>IN/OUT (DB9 connector)</b> | pin 1 = 19KHz output for RDS sync. (TTL output) (option ST)<br>pin 5 = external clock input for synchronisation, 2500Hz TTL<br>pin 7 = external reflected power control (20mA control loop)<br>pin 8 = external forward power control (20mA control loop)<br>pin 6-9 = ground<br>pin 2-3-4= not used |
| <b>20</b> | <b>R120</b>                   | ADJ multturn trimmer to adjust the threshold of overmodulation led (i.e. 75KHz) (option MF and ST).  |
| <b>21</b> | <b>R110</b>                   | ADJ multturn trimmer to adjust deviation meter (option MF and ST).   |

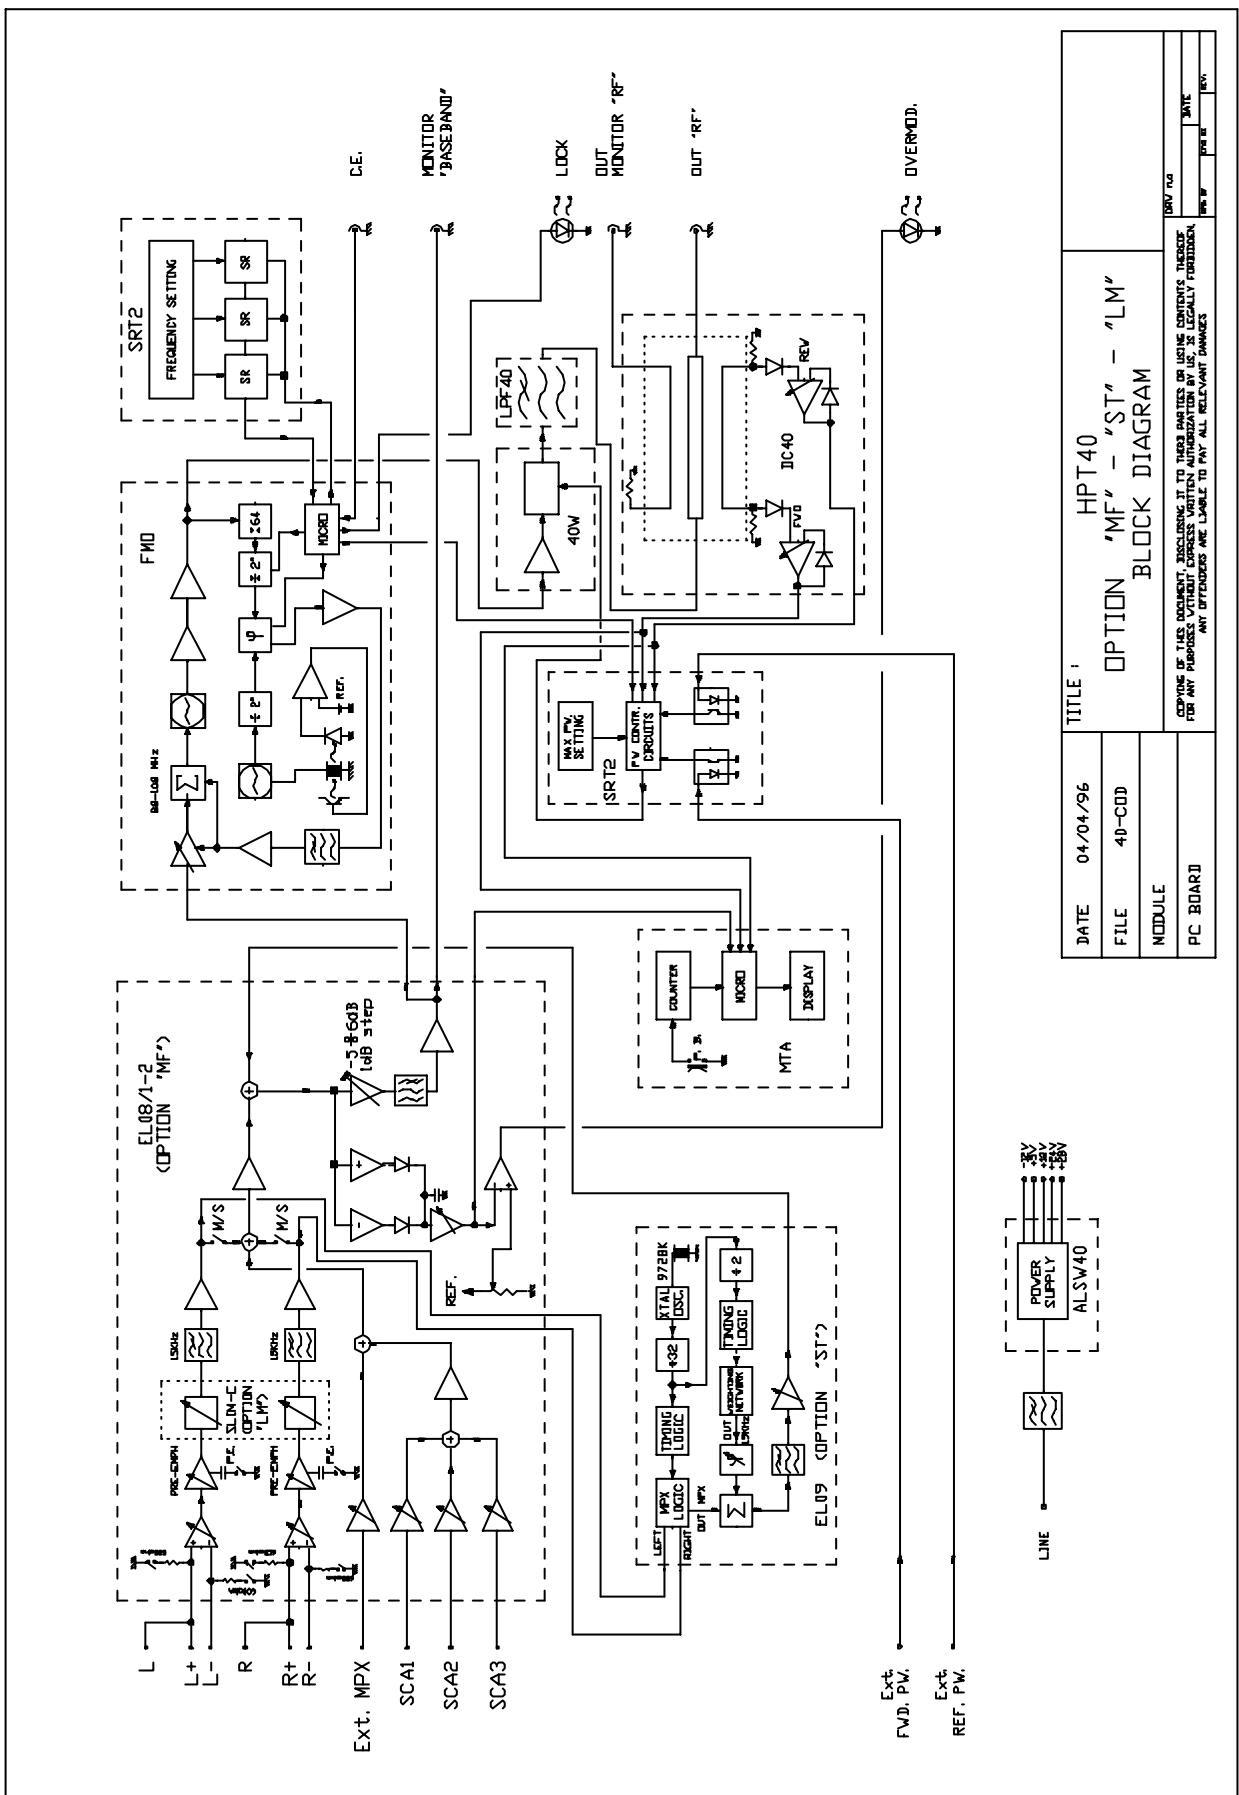

<b>22</b>	<b>R17</b>	ADJ multiturn trimmer to adjust Left ch. pre-emphasis (option MF and ST).
<b>23</b>	<b>R44</b>	ADJ multiturn trimmer to adjust Right ch. pre-emphasis (option MF and ST).
<b>24</b>	<b>LEFT ADJ.</b>	ADJ multiturn trimmer to adjust Left channel level (option MF and ST).
<b>25</b>	<b>RIGHT ADJ.</b>	ADJ multiturn trimmer to adjust Right channel level (option MF and ST).
<b>26</b>	<b>MPX</b>	BNC connectors, MPX (or Mono) input (option MF and ST).
<b>27</b>	<b>MPX ADJ.</b>	Multiturn trimmer for MPX input level adjustment. The level is factory set at +6dBm to obtain $\pm 75\text{KHz}$ dev.
<b>28</b>	<b>SCA1, SCA2, SCA3</b>	BNC connectors, SCA1, SCA2, SCA3 inputs (20KHz÷200KHz flat)
<b>29</b>	<b>SCA ADJ.</b>	Multiturn trimmers for SCA1, SCA2, SCA3 input level adjustment. They are factory set at +6dBm to obtain $\pm 7.5\text{KHz}$ dev.
<b>30</b>	<b>A.C. LINE</b>	ac Plug and Fuse Block & Voltage Change Plug (see Preface Chapter)
<b>31</b>	<b>EARTH</b>	Earth connection.
<b>32</b>	<b>FAN</b>	Fan, 110Vac.
<b>33</b>	<b>MPX</b>	BNC connectors, Balanced and unbalanced MPX inputs (option MX)

## REAR PANEL (OPTION MX)

<b>11</b>	<b>R.F. OUTPUT</b>	Type "N" connector, 50
<b>18</b>	<b>CARRIER ENABLE</b>	BNC connector carrier enable command: when connected to ground, the corresponding led (2) on the front panel and the R.F. power output are switched-off.
<b>19-5</b>		BNC connector: external clock input for synchronisation, 2500Hz TTL
<b>19-7</b>		BNC connector: external reflected power control (20mA control loop)
<b>19-8</b>		BNC connector: external forward power control (20mA control loop)
<b>27</b>	<b>MPX ADJ.</b>	Multiturn trimmer for MPX input level adjustment. The level is factory set at +6dBm to obtain $\pm 75\text{KHz}$ dev.
<b>28</b>	<b>SCA1, SCA2, SCA3</b>	BNC connectors, SCA1, SCA2, SCA3 inputs (20KHz÷200KHz flat)
<b>29</b>	<b>SCA ADJ.</b>	Multiturn trimmers for SCA1, SCA2, SCA3 input level adjustment. They are factory set at +6dBm to obtain $\pm 7.5\text{KHz}$ dev.
<b>30</b>	<b>A.C. LINE</b>	ac Plug and Fuse Block & Voltage Change Plug (see Preface Chapter)
<b>31</b>	<b>EARTH</b>	Earth connection.
<b>32</b>	<b>FAN</b>	Fan, 110Vac.
<b>33</b>	<b>MPX</b>	BNC connectors, Balanced and unbalanced MPX inputs (option MX)

## **ELC SYSTEM**

***BEFORE SUPPLYING POWER, VERIFY THAT THE VOLTAGE OF THE AC POWER TO BE USED IS THE SAME AS THE SPECIFIED VOLTAGE***

The power voltage for use is set at shipping, according to the specification when the order was received. If power voltage was not specified in the order, it is standard the 230Vac mode.

To change the standard specification to another, for example 110Vac, first remove the fuse in the AC line connector on the rear panel by sliding the plastic cover to the left side of the AC line connector and pulling the lever toward you. Then remove the voltage indicating panel from the fuse box and re-insert the voltage indicating panel so that 110V is displayed on the voltage indicating window on the lower of the fuse.

Finally insert the fuse in the box, slide the plastic cover to the right and connect the power cable to the AC line connector. Now you are ready to turn the power switch at the lower of the front panel ON.

When power is supplied, a self diagnostic test is running. The test sequence light the bar-leds on the Vu-meter and the control leds.

The internal dc voltages (-12, +5, +12, +24) are displayed by means of four leds. The device has a thermal compensated cristal, so warm it up for about 10 minutes to obtain the specified performance.

## **ELC SYSTEM**

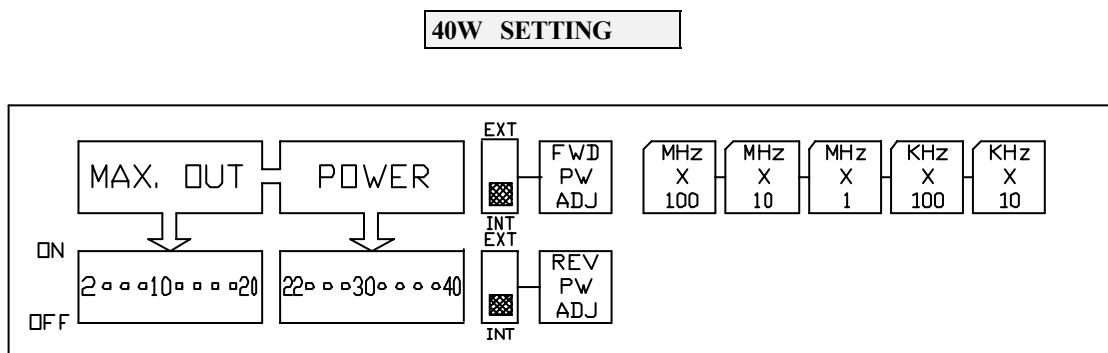

### **USER INSTRUCTIONS**

The EXCITER can supply a Maximum RF Power of the 36W, in the frequency range 87.5 - 108MHz

Before supplying power and connect it to Transmission Antenna or Power Amplifier, is necessary to execute this procedure:

- A) Verify that the voltage of the ac power to be used is the same as the specified voltage. If is necessary to change the standard specification to another, for example 110Vac, first remove the fuse in the Power Entry Module Filter with IEC Plug, Voltage Selector and Fuse Block on the rear panel by sliding the plastic cover to the left side of the AC line connector and pulling the lever toward you. Then remove the voltage indicating panel from the fuse box and re-insert the voltage indicating panel so that 110V is displayed on the voltage indicating window on the lower of the fuse. Finally insert the fuse in the box, slide the plastic cover to the right and connect the power cable to the AC line connector.
- B) Connect a dummy load capable of handling at least 50W, to the N connector labeled "RF OUT." An in-line wattmeter is also recommended
- C) Remove the digiswitch cover on the front panel by removing the two screws holding it on. Set the transmission frequency by use of the rotary-switches provided. The transmission frequency may be set in 10KHz increments. The switch increments from left to right are 100MHz, 10MHz, 1MHz, 100KHz, and 10KHz. A red LED indicator is also provided to indicate when the VCO is locked.
- D) On the front panel, in the frequency select window , there are two banks of 10 switches and, by the label "MAX. SET OUTPUT POWER", there are two banks of 10 LED indicators. **The switches are used to set the maximum power, that the Transmitter shall not exceed.** The first bank of 10 switches represents the power from 2 to 20 watts, while the second bank represents the power from 22 to 40 watts. **THERE SHOULD NEVER MORE THAN "ONE" SWITCH ON AT ANY TIME**. In the case where the operator selects more than one switch the unit will not execute the sum of the power, however an incorrect reading will be displayed on the indicator
- E) Located to the left of the Power control switch banks are two singol switches located one above the other. The top switch selects the Internal or External control of Direct Power Output while the lower switch selects Internal or External control of Reflected Power Output. **Place both switches in the "down" position which selects Internal power control**
- F) To the left of the left control switches are two small Trimmers. Rotate both controls full clockwise

- G**) Connect the equipment to the AC line and turn ON the power. Set the multimeter to the Direct Power Reading by pressing the square button until the red LED indicates the desired parameter has been selected.
- H**) Wait for a few seconds and observe that the red lock indicator light (TX PLL LOCK), indicating that the VCO is locked in to the frequency selected on the front panel. The direct power reading will come up slowly (5 seconds)
- i**) Adjust the top trimmer until the power does not go above the maximum desired power. Turning the trimmer counterclockwise will reduce the power.
- L**) Turn the reflected power control trimmer fully counterclockwise. The power output should decrease. Remove the antenna cable (VSWR= ) and adjust the trimmer so that the direct power output is approx. 4 watts. This adjustment sets the automatic fold-back control so that the HIGH VSWR conditions cause the transmitter to automatically go to a safe operating level
- M**) Reconnect the dummy load and the RF power should automatically come back up the desired level and to remain in ALC. This indicates that the transmitter now sees the correct load.
- N**) Remove power from the unit and connect the unit to the transmission antenna

## HPT40 MODULES DESCRIPTION

### POWER SUPPLY (ALSW40 module)

This module supplies -12.5V, +5V, +12.5V, +24V, +28V DC Voltages

The input is composed of 3 x Rectifier Bridges (RD1, RD2, RD3). RD1 bridge, powered by an 8V rms secondary of the toroidal transformer, supplies DC voltage of +5V through the 7805 regulator, RD2 bridge, powered by a 16Vrms secondary, supplies, through the L200 regulator, DC voltage of +12V and supplies the switching circuit, that, supplies, through the 7912 regulator, DC voltage of -12V.

RD3 bridge, powered by an 28Vrms secondary of the toroidal transformer, supplies, through an appropriate regulation circuit, DC voltage of +28V-5A, to 40W RF module. From this voltage, the U5 regulator supplies DC Voltage of +24V.

### LOW FREQUENCY CIRCUIT (BFI board) M version

The purpose of this module is to apply sound signals (mono, stereo, SCA) to the modulator. The input circuit for mono or stereo signals (with frequencies lower than 53kHz) is unbalanced with an input impedance of 0.6 or 10Kohm which may be selected by means of jumpers. The three unbalanced inputs for SCA signals accept input frequencies up to 200kHz.

After the first two stages, which allow regulation of the total gain, there is the pre-emphasis circuit by means of which variable time constants can be obtained between 40 and 80 microseconds (factory set at 50 $\mu$ S for CCIR, at 75 $\mu$ S for FCC)

The base band signal obtained in this way directly modulates the VCO, with a level of +6dB for maximum Deviation. On the module there is also a circuit to measure the level of the sound signal, whose output goes to the MTA board, for reading on the multimeter located on the front panel.

### LOW FREQUENCY CIRCUIT (EL08/1-2 boards) MF and ST versions

The “low frequency input filter” module is composed of two overlaying boards housed in the rear of the rack in direct contact with the input connectors;

It has the task of controlling the various input signals (MPX, Left, Right, SCA 1,2,3), filtering them, and sending them either to the modulator or to the stereocoder; in addition, there is also a low-pass filter for the internal or external multiplex signal. There is provision to set the various levels of both the single signals and the composite signal; it is possible to insert pre-emphasis and adjust the level of the overmodulation indicator.

Input levels are normally calibrated for 0dBm, 6dBm, or 12dBm, while output which is present also as a VDU on the front panel is set at a fixed level of 6 dBm (1550mVrms).

On the right- or left-hand channel there are two elliptical filters to ensure excellent suppression of the low frequency signal spectrum for frequencies greater than 15kHz; at 19kHz attenuation typically exceeds 50dB, while ripple in the band is around 0.1dB.

The analog signals are switched by means of very low distortion and noise analog switches.

The precision modulation intensity detector is peak-to-peak and gives error-free response up to and over 100kHz.

### **STEREO LIMITER CIRCUIT (SLIM board) MF/LM and S/LM versions**

The SLIM board, located between EL081 and EL082 boards, is composed of a LIM circuit and it intends to limit the frequency deviation at +/-75KHz; such circuit is inserted between the left and right audio inputs and the relevant 15KHz low pass filters. This circuit delivers three properly switched signals to an amplifier; this switching function is in relation with the audio level of the audio signal applied to the left and right channels. The intervention threshold is adjusted by the R1 trimmer, which automatically sets the positive and negative values.

If the audio input signal is lower than the threshold set, the audio input signal is delivered directly to the audio output without any level and phase variation.

If the audio input signal exceeds positively or negatively the thresholds set, a negative and positive voltage exactly equal to the threshold value is then delivered to the audio output.

The following low pass filter located at the EL081 board, eliminates the harmonics and eventual switching glitches caused by the audio signal clip.

The group delay of the low pass filter may originate small oscillations on the clip, but the level of these oscillations doesn't increase the deviation more than 1dB, even if the audio input level will double.

### **STEREO GENERATOR CIRCUIT (EL09 module) S version**

The audio signals coming from the input boards containing the 15KHz audio filters enter the MPX module (EL09 board) at J1 and J2 respectively. They are then taken to the level of 2Vrms by U12 and U13 then enter the analog switches that work at a frequency of 608KHz.

This commutation frequency is a multiple of the pilot tone frequency (19KHz) and it is derived from a crystal oscillator (U3) operating at 9728KHz and from two shift-registers (U5). This makes it possible to have the commutation spurious emissions of the multiplex signal at a much greater frequency than the maximum frequency of the stereophonic signal and so they can easily be eliminated with a Bessel filter of the fifth order on the input boards. Since this Bessel filter's cut-off frequency is over 300KHz, its response in amplitude and phase within the 53 KHz is excellent and therefore does not prejudice separation of the left and right channels of the stereophonic signal.

The R8 trimmer is used to balance the two commutation signals and should be adjusted to have maximum suppression of the 38KHz.

The R12 trimmer polarizes the analog switches and adjusts itself for minimum distortion of the decoded signal.

The 19KHz subcarrier is also generated by the 9728KHz crystal; after the integrated circuit U3 has been divided by U3 with its eight "shifted" outputs, it makes it possible to build the pilot tone frequency by approximation by means of a weighted sum. The amplitude of the 19 KHz pilot tone is adj by R59, while R57 adj its phase.

The multiplex signal is summed with the pilot tone frequency with a suitable weight through the operational amplifiers U15 and U16; these have a continuous coupling and their offset is zeroed by R36; the R70 trimmer adj the level of the output signal, normally adj at +6dBm, same value of the EL09 audio inputs

### **VCO CIRCUIT (FMO module)**

This module includes a section enclosed in an aluminium screened box containing a very-low-noise FET oscillator and relative amplifier, a modulation circuit whose great linearity throughout the FM band is ensured by an original compensating circuit, and a VCO input for the frequency control loop.

Outside this aluminium screened box there is the section for digital frequency synthesising, obtained by means of a microprocessor that acquires the frequency set on the front panel by means of dip-switches and it programs a series of dividers with the purpose of lowering the frequency of the VCO to the comparison level, which may be obtained by the crystal thermostatic oscillator located inside the module, or by using an outside sample source with a frequency of 2500Hz.

### **MULTIMETER CIRCUIT (MTA board)**

The MTA board displays on the front panel the working condition of the most important transmitter parameters

The power supply voltages (-12, +5, +12, +24Vdc) are displayed from 4 leds located on the left side of front panel

The analog voltages showing the Direct Power, Reflected Power, peak and semi-peak modulation, are displaying from "BAR-GRAF" with a resolution of the 40 leds that make sure a reading accuracy to agree with measurement trasductor. The selected function is displayed from respective led.

The Deviation Measurement (full-scale is 100KHz) is derived from peak to peak detector circuit with response very accuracy also for MPX signals. Moreover is displaying the semi-peak modulation with the aid of a microprocessor that read the maximum deviation peak every 300msec. This function is useful in order to verify the frequency deviation value with "musical" signal. Infact the choice of use of the "BAR-GRAF" is necessary in order to have a good response with "music" signal.

The led C.E. (carrier enable) shows the enable of the RF POWER MODULE, (with VCO module always frequency locked), in case the transmitter is used in a Active Reserve System

### **RF AMPLIFIER AND POWER CONTROL SECTION (40W, LPF40, DC40 AND SRT modules)**

#### **RF AMPLIFIER SECTION (40W, LPF40 and DC40 modules)**

This includes the RF Amplifier, the Low Pass Filter and the Directional Coupler modules. The first represents a power amplifier with gain higher than 36 dB and bandwidth 87.5-108 MHz; the typical input exciting power is 10dBm (+/-3dBm). All the stages are in AB Class to ensure an adequate stability even with very low output powers. The trimmer R10 fixes the polarization of the second stage, whereas the R17

fixes that of the last one. The amplifier which supplies more than 60W output power on the whole range, is followed by a Low Pass Filter of 9th order which ensures, with a ripple in lower band of 0.1dB, a rejection of the harmonics better than 70 dB; its typical insertion loss is lower than 0.3 dB within the 87.5-108Mhz, and exceeds 42dB at 176Mhz. After the Low Pass Filter, before the output antenna connector, we find the Directional Coupler module (strip-line configuration) which, besides showing the direct and reflected power, controls the figures and grants a protection of the Power Transistor in case of wrong functionning of the output load. This circuit is completed shield, ensuring a typical decoupling between direct and reflected power higher than 20dB and therefore a reading precision better than 5%. The detected voltages, proportional to the two RF powers, go on two operational amplifiers which amplify their value, taking into consideration the thermic drift of the detector diodes. The Directional Coupler Insertion Loss is lower than 0.2dB.

### **POWER CONTROLLER CIRCUIT (SRT board)**

This board, fixed on the internal side of the front panel, has two functions: the acquisition (by means of 5 decimal dip-switches) of the frequency, to be sent to the microprocess located on the FMO module by means of a shift-register PISO, and the control of the directed and reflected powers. This control is effected by pre-setting 20 dip-switches of the total desired power (2 40W) and, inside it, of the directed and reflected power, by means of a trimmer.

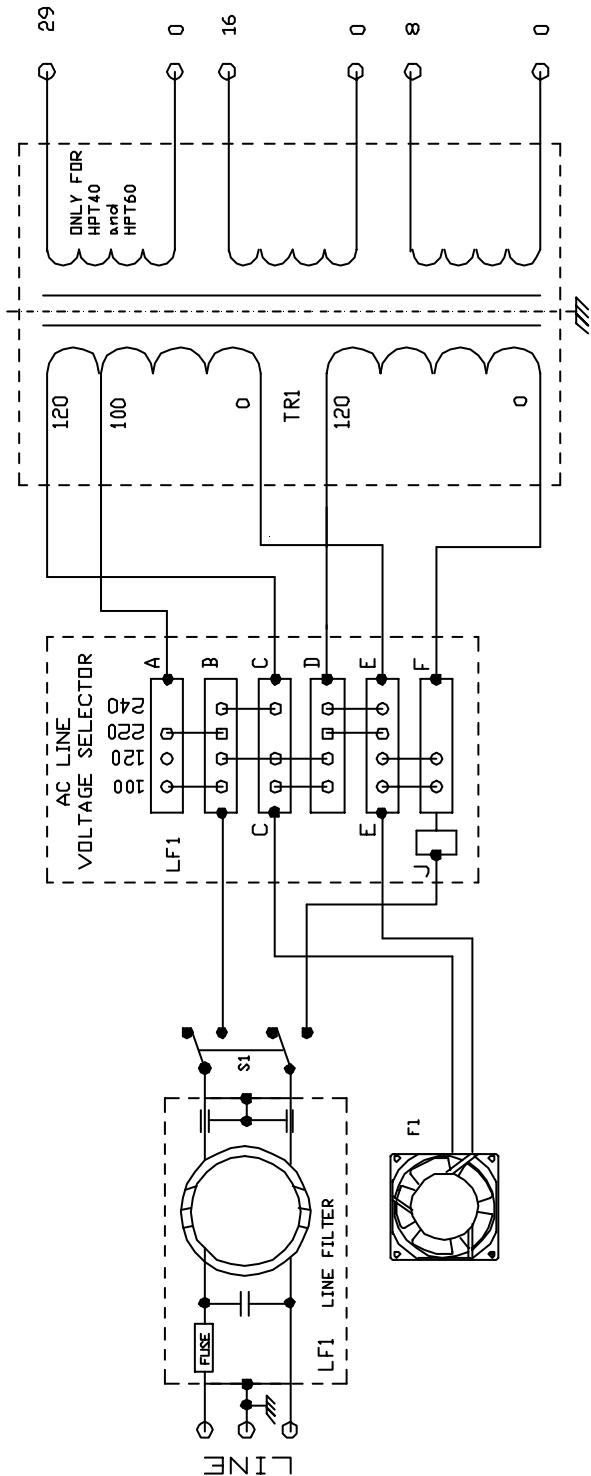

By means of two optoisolated inputs, it is possible to control the power of an external amplifier driven by this unit, provided it is supplied with the suitable directional coupler.

# PROCEDURES OF THE HPT40 ADJUSTMENTS

## TEST EQUIPMENT DETAILS

TYPE	PERFORMANCE	MODEL	MANUFACTURER
Signal Generator	100 KHz - 1000 MHz	SMX	Rohde & Schwarz
Oscilloscope	DC - 60 MHz	PM 3050	Philips
Spectrum analyzer	50 Hz - 2.9 GHz	HP - 8560A	Hewlett Packard
Modulation Analyzer	50 KHz - 5.2 GHz	FMB	Rohde & Schwarz
Digital Multimeter	5 ½ digit	UDL44	Rohde & Schwarz
Attenuator	40 dB - 100 Watt	16-3763	Delta Ohom
Thruline Wattmeter	50 - 125 MHz 5 Watt	43	Bird
RF Power Meter	10 MHz - 18 GHz	6950	Marconi Instruments

### 1 PRELIMINARY CHECK

- 1.1 These technical procedures must go with the fill of the ADJUSTMENT FORM
- 1.2 Please see the details written on the INPUT and QUALIFICATION FORMS
- 1.3 Make sure the voltage-switchover (located inside the AC socket on the rear panel) is set properly and that the fuse housed in the same socket is of the right value according to the AC voltage used (see the "PREFACE" chapter in this manual) and power up the equipment

## **2      ALSW40 POWER SUPPLY**

- 2.1    Adj. R6 trimmer of ALSW40 to bring the voltage on the passing capacitor CP11 (Red wire) to the value of 12.5VDC
- 2.2    Adj. R21 trimmer of ALSW40 to bring the voltage on the passing capacitor CP10 to the value of 28VDC
- 2.3    Check the DC voltages on the grey, bleu and white wires, in order to have +5V, +24V, -12V
- 2.4    To stress by plastic screwdriver the soldering of ALSW40 board, and verify the correct fixing of the power transistor screws
- 2.5    To write these values on the ADJUSTMENT FORM

## **3      EL08 board - LIM C**

- 3.1    Verify the requested Input Impedance (600 or 10Kohm) and consequently insert the J1, J2, J3 and J4 jumpers in correct position. Test the switches of the PRE-EMPHASIS and of the EXT-INT STEREO. Switch off the internal stereo coder and the Pre-emphasis, verify the position of the 1dB step Attenuator, located on the rear panel, normally adj. @ 0dB.
- 3.2    Insert an audio signal, from FMB Modulation Analyzer and with the same level highlight on the INPUT FORM, into LEFT input and to verify with AC multimeter the correct value, and balance, if necessary, the voltage drop due to Output Impedance of the Audio Generator. Connect the BASEBAND output to Oscilloscope and check the distortion @ 1KHz Audio Input Signal, and, if necessary, adj. R13 trimmer to have minimum distortion
  - 3.2.1    Set the Audio Signal Generator @ 19KHz and adj. L2 coil to minimum distortion
  - 3.2.2    Set the Audio Signal Generator @ 21.5KHz and adj. L3 coil to minimum distortion
  - 3.2.3    Set the Audio Signal Generator @ 1KHz, make a reference to 0dBr, and adj. L1 coil in order to have the same value @ 15KHz
  - 3.2.4    Verify the ripple in 1KHz-15kHz band, no more than +/-0.15dB, refereed to 1KHz
  - 3.2.5    Set the Audio Signal Generator @ 15KHz and 20dB minus of the Nominal Audio Input (-14dBm is corresponding to 6dBm Nominal Audio Input), and adj. R13 & R17 for choice pre-emphasis value (50 or 75 S)
  - 3.2.6    Turn the pre-emphasis OFF and set the Audio Signal Generator @ 1KHz and Nominal Audio Input, and adj. R13 trimmer in order to have 1550 V rms to BASEBAND output

- 3.3 Repeat the procedures 3.2 for RIGHT channel, replacing these values  
 R14 with R40              L1 with L4  
 R17 with R44              L2 with L5  
 L3 with L6
- 3.4 Set the Audio Signal Generator @ 1KHz and Nominal Audio Input into MPX audio input, and adj. R53 trimmer in order to have 1.550Vrms to BASEBAND output
- 3.5 Set the Audio Signal Generator @ 57KHz and Nominal Audio Input into SCA 1, 2, 3 audio inputs, and adj. R85, R92 and R98 trimmers in order to have 155mV rms to BASEBAND output (typical value)
- 3.6 Set the Audio Signal Generator @ 1KHz and Nominal Audio Input into MPX audio input, and adj. R110 trimmer in order to have 75KHz Deviation to BAR-GRAF multimeter
- 3.7 Set the Audio Signal Generator @ 1KHz and Nominal Audio Input into MPX audio input, and adj. R120 trimmer in order to have lighted the over-modulation led
- 3.8 Check by BASEBAND Output if the 1dB step Attenuator is working
- 3.9 With Deviation Limiter option, set the Audio Signal Generator @ 1KHz and Nominal Audio Input into LEFT audio input, and adj. RT1 trimmer of the LIM board in order to see the CLIPPER function on the Oscilloscope connected to BASEBAND Output
- 3.10 Stress by plastic screwdriver the soldering of EL08/1-2 and LIM C boards

#### **4 STEREO CODER EL09**

- 4.1 Insert an audio signal, from FMB Modulation Analyser set @ 1KHz and Nominal Audio Input into LEFT audio input, turn on the stereo coder by switch, connect the BASEBAND output to Oscilloscope and check the presence of MPX signal, adj. the C24 capacitor in order to synchronise the 19KHz sub-carrier with 1KHz envelope
- 4.2 Adj. R57 trimmer to get 2.8Vrms @ 19KHz on pin nr 7 of U14
- 4.3 Disconnect the audio input signal, connect the BASEBAND output to Oscilloscope and check the sub-carrier, adj. R36 trimmer for no offset
- 4.4 Adj. R12 trimmer to get 6V dc on R110
- 4.5 Disconnect the audio input signal, connect the BASEBAND output to FMB and check the 19KHz sub-carrier distortion value, better than 0.5%

4.6 Set the Audio Signal Generator @ 1KHz and Nominal Audio Input into LEFT+ audio input, and connect same signal into RIGHT- and Oscilloscope External Trigger, connect the Oscilloscope CH1 input to BASEBAND output and check the presence of the double envelope, with superimposed the 19KHz pilot tone; optimisme the cross-talk of the two envelopes and to make coincide Left cross-talk with Right cross-talk by R59 pilot tone phase trimmer

4.7 Set the Audio Signal Generator @ 1KHz and Nominal Audio Input into LEFT audio input, and connect BASEBAND output to STEREO DECODER; check the Left&Right separation. For improve the separation adj R30 trimmer in order to get 70dB or better. If necessary, add a suitable capacitor (typ 330 pF-1800 pF), in parallel to C43 capacitor, by the C10 & C42 free holes (components not mounted)

4.8 Repeat the 4.7 procedure for RIGHT audio input, and act on the R59 and R30 trimmers in order to have better Separation in the 87.5-108MHz band and both audio channels

4.9 Check the Vpp of the MPX signal, with nominal audio input, and act on the R70 trimmer to have 1.1Vpp value; therefore turn off the nominal audio input and to measure the subcarrier value, acting on the R36 trimmer to have 110mVpp value

4.10 Set the Audio Signal Generator @ 1KHz and Nominal Audio Input into LEFT audio input, and check the distortion of the decoded MPX, and optimize the distortion by R12 trimmer (typ. <0.02%)

4.11 Set the Audio Signal Generator @ 15KHz and Nominal Audio Input into LEFT+ audio input, and connect same signal into RIGHT-; in this way you transmit the stereo information only, and this condition represents the very worst event for engaged base band and out band spurious emission.

Connect the Spectrum Analyzer to BASEBAND output, through Oscilloscope Probe, set @ x1  
Adj the pilot subcarrier at - 21dBr, and check in 0-53 KHz band the presence of two lines with -7dBr @ 23KHz and 53KHz

Check the 38KHz suppression (typ 65dBr), the line at 15KHz (typ. 50dBr), and if necessary adj. very fine the audio input level (left or right) and/or the L1 or L4 coil composing the 15KHz Low Pass Filter.

Moreover to check the response of the out band spurious in the 53-200KHz band (<65dBr) and in the 200-1000KHz band (<70dBr)

4.12 Stress by plastic screwdriver the soldering of the board

## 5 VCO module FMO

5.1 Disconnect the audio input cable from input BNC connector (BF-IN), adj the voltage value in order to have 3.16Vdc on the 1 pin of the U6 (corresponding to crystal temperature =50°C)

5.2 After setting the rotary switches @ 100MHz, connect the OUT-VCO connector to S.ANALYZER, in order to check the spurious emission, with CENTER FREQUENCY=100MHz, SPAN=100MHz, REF LEVEL=20dBm. Turn off and turn on the exciter and to check at the S.A. the 100 MHz signal =10-12dBm

5.3 Connect the OUT-VCO connector to MODULATION ANALYZER, in order to check residual noise value lower than 9Hz (CCIR filter inserted)

5.4 Turn C36 capacitor to have the precision frequency 100MHz +/-100Hz

5.5 Reconnect the audio input cable from input BNC connector (BF-IN), turn off the Pre-emphasis by switch, turn off the stereo coder by switch, set the Audio Signal Generator @ 1KHz and Nominal Audio Input into LEFT audio input, adj the deviation at 75KHz by RT1 trimmer. Change the transmitter frequency in the range 87.5-108MHz and verify the range (included +/-1dB). If necessary adj RT1 trimmer

5.6 Stress by plastic screwdriver the soldering and mechanical parts of the board

## **6 RF AMPLIFIER MODULE AND ACCESSORIES (DC40, 40W and SRT boards)**

6.1 Disconnect the RF input cable from the 40W module, set in ON position the dip-switches nr 10 and 20 of the MAX SET OUTPUT POWER SWITCHES, located on the EL10 Front Panel board

6.2 Turn anti-clockwise the two trimmers RT1 and RT3 of the Directional Coupler; cancel the output offset on CP1 and CP2, by acting on RT2 and RT4

6.3 Act on the R10 trimmer (40W module) to have 0.35V drop in parallel to 1 ohm R8 resistor, corresponding Idriver =350mA

6.4 Act on the R17 trimmer (40W module) to have 0.33V drop in parallel to 0.33 ohm R13 resistor, corresponding Ifinal =1A

6.5 Connect a 50W Dummy Load, a 40dB attenuator, a reflected PWR Wattmeter, a Bolometer, in serie to RF Output of Transmitter; set the RF Signal Generator @ 98MHz and 12dBm output, connect the RF signal generator to RF-IN of the 40W module; turn clockwise RT1 and RT2 trimmer (SRT board), to have 40W output power

6.6 Set the RF Signal Generator @ 88MHz and 108MHz, to have 40W output power; if necessary, modify L13 coil dimension or adj the bias of the driver transistor and final transistor

6.7 Set the RF Signal Generator @ 100MHz and turn anti-clockwise RT2 trimmer of the SRT board to decrease the output power till to reach 20W or similar on the panel Wattmeter; the Bolometer will read a value lower than 40W; now adj L4 coil (DC40 module) to have same Bolometer reading in the range 88-98-108MHz; now set the RF Signal Generator @ 98MHz and act on the trimmer RT2 (DC40 module) to have 20W or similar on the Bolometer reading

6.8 Set in OFF position the dip-switches nr 20 of the MAX SET OUTPUT POWER SWITCHES, located on the SRT Front Panel board (so is set 20W O.P.); turn the Directed Power Trimmer to the full

scale (clockwise); the Bolometer will read a PWR value higher than 20W; now adj RT3 trimmer to have 20W on the Bolometer reading

6.9 Set different MAXIMUM OUTPUT POWERS by selected the MAX SET OUTPUT POWER SWITCHES, and verify the correct reading

6.10 Turn the RT1 trimmer (SRT board) of the reflected power completely anti-clockwise; disconnect the Dummy Load, and reading the PWR of the reflected PWR Wattmeter, turn the RT1 trimmer (SRT board) of the reflected power to have 4W reading on the exciter leds-bar; set the RF Signal Generator @ 88-98-108MHz and modify L13 coil dimension (DC40) to have a constant value on the reflected PWR Wattmeter; set the RF Signal Generator @ 98MHz and adj RT2 trimmer (DC40 module) to have 4 W reading on the exciter leds-bar

6.11 Stress by plastic screwdriver the soldering and mechanical parts of the board, and fill in the ADJUSTMENT FORM

## 7 **BFI board**

7.1 Verify the requested Input Impedance (600 or 10Kohm) and consequently insert the Z1 and Z2 jumpers in correct position, for MPX input

7.2 Insert Z3 Pre-emphasis Jumper in ON position; set the Audio Signal Generator @ 15KHz and minus -20dBm, into MPX input; connect the Output Monitor to MODULATION ANALYZER, adj P5 trimmer to have a value difference of the 13.67dB from Pre-emphasis ON and OFF (16.84dB for FCC)

7.3 Disconnect the Pre-emphasis, set the Audio Signal Generator @ 1KHz and Nominal Audio Input into MPX+ audio input; adj P1 trimmer, located next to MPX+ audio input connector, to read 1550mV rms on the Modulation Analyzer. Same procedure and final result for MPX- audio input

7.4 Set the Audio Signal Generator @ 57KHz and Nominal Audio Input into SCA1 audio input; adj P2 trimmer, located next to SCA1 audio input connector, to read a correct ratio with previous MPX output on the Modulation Analyzer

7.5 Repeat the procedures 7.4 for SCA2 audio input, adj P3 trimmer

7.6 Repeat the procedures 7.4 for SCA3 audio input, adj P4 trimmer

7.7 Set the Audio Signal Generator @ 1KHz and Nominal Audio Input into MPX+ audio input; adj P6 trimmer (BFI board) to read 75KHz deviation on the exciter leds-bar

## PROCEDURES OF THE ELC40 TEST

### TEST EQUIPMENT DETAILS

<b>TYPE</b>	<b>PERFORMANCE</b>	<b>MODEL</b>	<b>MANUFACTURER</b>
Spectrum Analyzer	9 Khz - 26.5 Ghz	HP-8563E	Hewlett Packard
Signal Generator	100 Khz - 1000 Mhz	SMG	Rohde & Schwarz
Audio Analyzer	10 hz - 100 Khz	UPA	Rohde & schwarz
Multifunction Synthesizer	DC - 600 Khz	HP - 8904-A	Hewlett Packard
Oscilloscope	DC - 60 Mhz	PM-3050	Philips
Digital Multimeter	6 ½ digit	8840-A	Fluke
Modulation Analyzer	55 Khz - 1360 Mhz	FAM	Rohde & Schwarz
Stereo monitor decoder	20 hz - 15 Khz	FMS - 2	Belar
Stereo Coder	40 hz - 15 Khz	MSC2	Rohde & Schwarz
Stereo Decoder	40 hz - 15 khz	MSDC2	Rohde & Schwarz
Thruline Wattmeter	50 - 200 Mhz	Model 4412	Bird
Coaxial Resistor	50 ohm - 500 Watt	Model 8201	Bird

### **1      PRELIMINARY COMMENT**

1.1    This technical procedures must to go with the fill of the TEST FORM

1.2    The TEST of the HPT40 exciter must to be realized by different engineering (no ADJUSTEMENT technician) and different Test Equipment

1.3    Before realise the TEST verify the ADJUSTEMENT, INPUT and QUALIFICATION FORMS, in order to note the possible previous faults indicated from previous technicals, or customer request

## **2      ALSW40 POWER SUPPLY**

2.1     Connect a 50W Dummy Load in serie to RF Output of Transmitter; and TURN ON the exciter set @ 100MHz, maximum RF POWER

2.2     Check the DC voltages, on the output wires, with following tollerance:

VOLTAGE (V)	+ max (V)	- max (V)	ripple (mV)	colour
-12	1	1	< 5	white
+5	0.2	0.2	< 5	grey
+12.5	0.5	0.5	< 8	red
+24	1	1	< 5	bleu
+28	0.1	0.5	< 60	red-big

2.3     Stress by plastic screwdriver the soldering of ALSW40 board, and verify the correct fixing of the power transistor screws

## **3      EL08 board - LIM C**

3.1     Set the UPA Modulation Analyzer @ Nominal Audio Input into LEFT input and verify with AC multimeter the correct value, and to balance, if necessary, the voltage drop due to Output Impedance of the Audio Generator, take off the Pre-emphasis and to switch off the internal stereo coder, verify the position of the 1dB step Attenuator, located on the rear panel, normally adj. @ 0dB

3.2     Set the UPA Mod. Analyzer @ 1KHz and verify from BASEBAND output the level =+6dBm 01dB

3.3     Verify the ripple in 1KHz-15KHz band, lower than 0.15dB, referred to 1KHz

3.4     Verify the out band attenuation >45dB in the range 19KHz-53KHz

3.5     Set the Audio Signal Generator @ 15KHz and 20dB minus of the Nominal Audio Input (-14dBm is corresponding to 6dBm Nominal Audio Input), and verify the correct Pre-emphasis Response (13.67dB for 50uS and 16.84dB for 75uS)

3.6     Repeat the procedures 3.2, 3.3, 3.4, 3.5 for RIGHT audio input

3.7     Switch off the Pre-emphasis

3.8     Check the requested Input Impedance

3.9     Check the light up of the OVERMODULATION LED, with 0.5dB of the Audio Input Variation

3.10 Set the Audio Signal Generator @ Nominal Audio Input into MPX audio input, and verify the correct value =1550mVrms 0.1dB to BASEBAND output

3.11 Set the Audio Signal Generator @ 57KHz and Nominal Audio Input into SCA 1, 2, 3 audio inputs, and verify the value =155mVrms to BASEBAND output (typical value)

#### 4 **EL09 STEREO CODER TEST**

4.1 Switch ON the internal stereo coder, and verify on the BASEBAND output the 19KHz sub-carrier level (-14 17dBm). Typically is -14dBm or 155mVrms

4.2 Verify the 19KHz sub-carrier distortion, better than 0.5% (value proportional to 38KHz suppression)

4.3 Set the Audio Signal Generator @ 1KHz and Nominal Audio Input into LEFT audio input, and check the Stereo Separation on the BELAR Stereo monitor

4.4 Repeat the procedure 4.3 for RIGHT audio channel

4.5 Extend the previous measure in the audio range 40Hz, 300Hz, 1KHz, 5KHz, 15KHz for LEFT and RIGHT audio channel, with Pre-emphasis (Exciter) and De-emphasis (BELAR Stereo monitor) OFF

4.6 Repeat the previous procedure with the MSDC2 Rohde Schwarz Stereo Decoder, and verify the results better than 60dB; if necessary adj the Stereo Decoder Equipment with the same phase, through the HP multifunction Synthesizer; if necessary, adj the 19KHz pilot phase (EL09 module)

4.7 Set the UPA Audio Analyzer @ 1KHz and Nominal Audio Input into LEFT audio input, and connect the BELAR Decoder to BASEBAND output; take the Belar Decoded and De-emphasis Output into UPA Audio Analyzer, and check the distortion better than 0.03%

4.8 Connect RF EXCITER PROBE at FAM RF INPUT, take FAM REAR MPX OUTPUT and connect it at BELAR Decoder; in this condition repeat the procedures 4.3, 4.4, 4.5 and verify the stereo-separation better than 48dB (this value is the limit for this test equipment)

4.9 Hold the test equipment how previous procedure, connect the Belar Decoded and De-emphasis Output into UPA Audio Analyzer, check the S/N with 300Hz audio signal and nominal audio input, make a reference at 0dBr, disconnect the audio input and read the result on the UPA equipment better than 80dB

4.10 Repeat the 4.9 procedure, taking the BASEBAND monitor instead of FAM REAR MPX OUTPUT, and read the result better than 85dB

4.11 Stress by plastic screwdriver the soldering of EL09 board

## **5      FMO module (VCO Oscillator)**

5.1    Check that the voltage on the pin nr 1 of the U6 is 3.16V - 0.01V; touch with finger the crystal case in order to verify the tolerant temperature (50°C); infact any problem in this circuit bring the temperature at two possible values, ambient temperature or 70°C

5.2    Set the front panel rotary-switches @ customer frequency or 100MHz, connect RF probe to FAM, and check the frequency precision (100Hz tolerance)

5.3    In this condition, check the Residual Noise value in the range indicate from the TEST FORM, value lower than 5Hz in the range 30Hz-20KHz; check the S/N weighted (CCIR option), value better than 77dB, refered at 75KHz and De-emphasis off

5.4    Connect the VCO output to Spectrum Analyzer, and check the amplitude, included in the range 10 - 13dBm

5.5    Set the front panel rotary-switches @ 88 MHz, check that the voltage on the pin nr 1 of the U4 is higher than 3V

5.6    Set the front panel rotary-switches @ 108MHz, check that the voltage on the pin nr 1 of the U4 is higher than 10V

5.7    Set the front panel rotary-switches @ frequencies displayed on the TEST FORM, with set the following parameters: MONO mode, 1KHz Audio Signal and nominal audio input; check that the frequency deviation is 75KHz - 1dB

5.8    In the previous condition, check that the DISTORTION is better than 0.03%

5.9    Stress by plastic screwdriver the soldering of the VCO module; check also the microphonique quality

## **6      OUTPUT POWER**

6.1    Set the front panel rotary-switches @ 87.5MHz, set in ON position the dip-switches nr 10 and 20 of the MAX SET OUTPUT POWER SWITCHES, located on the SRT Front Panel board; the RF Output Power will reading higher than 38W (with the Direct PWR trimmer to the full scale, clockwise); check now on the S.Analyzer that the second Harmonic is better than 70dBc (attention to saturation of the S. Analyzer RF input)

6.2    Set now in OFF position the dip-switch nr 20 of the MAX SET OUTPUT POWER SWITCHES (so is set 20W O.P.); the Output Power will reading 20 W - 1W

6.3    Disconnect the Dummy Load, and read than the Reflected Power is 4W - 1W. Check on the Spectrum Analyzer the Spurios presence (due to Final Stage instability)

- 6.4 Repeat the procedures nr 6.1, 6.2 and 6.3 for 98MHz Output Frequency
- 6.5 Repeat the procedures nr 6.1, 6.2 and 6.3 for 108MHz Output Frequency
- 6.6 Check the RF coaxial cables and respective RF connectors, and stress by plastic screwdriver the solderings

## 7 AUDIO FREQUENCY (BFI board)

- 7.1 Read the Customer request, regarding the MPX Input Impedance (600 or 10Kohm) and consequently insert the Z1 and Z2 jumpers in correct position
- 7.2 Insert Z3 Pre-emphasis Jumper in ON position; set the Audio Signal Generator @ 15KHz and minus -20dBm, into MPX+ input; connect the Output Monitor to MODULATION ANALYZER and check that the value difference is 13.67dB from Pre-emphasis ON and OFF (16.84dB for FCC)
- 7.3 Disconnect the Pre-emphasis, set the Audio Signal Generator @ 1KHz and Nominal Audio Input into MPX+ audio input; check that the Output monitor is 1550mVrms
- 7.4 Set the Audio Signal Generator @ 57KHz and Nominal Audio Input into SCA1 audio input; check that there is a correct ratio between MPX and SCA
- 7.5 Repeat the procedures 7.4 for SCA2 audio input
- 7.6 Repeat the procedures 7.4 for SCA3 audio input
- 7.7 Set the Audio Signal Generator @ 1KHz and Nominal Audio Input into MPX+ audio input; check that the exciter leds-bar are reading 75KHz deviation
